

ABSTRACT OF THE DISCLOSURE

A method, which enables a user of a cellular phone to send a desired message to the other party when making a telephone call, is provided. When a user make a telephone call by a cellular phone, audio data stored in a memory in advance or audio data that are converted from text downloaded from the outside by an e-mail receiving function etc. or text inputted by operating a keyboard are automatically reproduced after a prescribed period of time has passed from when the cellular phone receives a CONN signal that is sent from a base station corresponding to a reply of the other party. After the reproduced voice message is transmitted to the other party, the call is automatically terminated (disconnected).
